

BRIEF

CAS / CANN CRM Architecture and Data Completeness Internal Review

Evidence, Hypotheses, and Clarifications Required for Structural Integrity

Review Objectives and Scope

This review addresses two operational requirements.

- The CRM must operate as the single source of truth for all CAS and CANN members and related contacts.
- Administrative users must have complete visibility into membership status, professional attributes, and communication consent to manage engagement and outbound communication.

This analysis reconciles three artifacts.

- Client-approved front-end registration forms.
- Architecture documentation provided.
- CRM data extract received.

Findings, working hypotheses, and clarification requests follow.

Data Completeness and Extract Scope

Observations

The data extract provided does not display the full set of standard and custom fields described in the architecture documentation. Several attributes visible in the front-end forms are not visible in the extract reviewed.

The extract appears to reflect a limited export rather than a confirmed full Leads module schema.

Working Hypotheses

Two structural conditions explain this gap.

- A full module-level export exists but has not been provided.
- The extract provided represents the complete deployed schema.

Each condition produces different implications for field persistence and architectural integrity.

Clarifications Requested

- Provide a full Zoho Leads module export including all standard and custom fields.
- Confirm whether the prior extract represented a filtered view, integration table, or full module export.
- Confirm that all form-captured attributes persist as discrete CRM fields.

Membership Logic and Dependency Enforcement

Observations

The registration form presents CAS and CANN as independent Yes / No selections. Form language defines all CANN members as CAS members. The architecture documentation does not clearly identify the enforcement mechanism for this dependency.

The data reviewed does not confirm whether workflow or validation rules ensure CANN = Yes results in CAS = Yes.

Working Hypotheses

- If dependency logic is enforced through workflow or validation rules, segmentation remains deterministic.
- If dependency logic is not enforced structurally, contradictory membership states may exist in the dataset.

Clarifications Requested

- Identify the mechanism that enforces CANN membership dependency on CAS membership.
- Confirm whether any records contain CANN_Registration = Yes and CAS_Registration = No.
- Provide remediation logic for contradictory records.

Four Membership Scenarios

Scenario A — CAS = Yes, CANN = No

Registrant selects CAS membership only.

CRM record should store CAS_Registration = Yes and CANN_Registration = No. The record should appear in CAS views and be excluded from CANN views unless consent criteria apply.

- Confirm both membership fields persist independently and are queryable.

Scenario B — CAS = No, CANN = Yes

Registrant selects CANN membership while declining CAS at the interface level.

Form language defines CANN members as CAS members. CRM must enforce CAS_Registration = Yes whenever CANN_Registration = Yes.

- Confirm how dependency enforcement is implemented.
- Confirm absence or correction of contradictory records.

Scenario C — CAS = Yes, CANN = Yes

Registrant selects both memberships.

CRM record should store CAS_Registration = Yes and CANN_Registration = Yes and support independent segmentation.

- Confirm both flags persist and are usable in list construction.

Scenario D — CAS = No, CANN = No

Form branches to non-member contact intake collecting limited inquiry data.

Record represents an inquiry rather than a membership registration. CRM must differentiate this record type to preserve segmentation integrity.

- Confirm how inquiry records are classified in Zoho.
- Confirm deterministic exclusion from membership and campaign views.

Record Type Differentiation

Observations

The architecture materials do not clearly document structural differentiation between membership registrations and non-member inquiries.

No explicit record classification field is identified in the documentation reviewed.

Working Hypotheses

- If inquiry records share the same module without classification, segmentation relies solely on membership flags.
- If a record classification field exists, it should isolate inquiry records from member views and campaigns.

Clarifications Requested

- Describe how non-member contact submissions are stored.
- Confirm whether a Record_Type or equivalent field exists.
- Confirm the rules used to exclude inquiry records from membership and communication views.

Field Mapping Integrity

Reconciliation Framework

The table below enumerates all visible form fields and reconciles their presence across three artifacts.

- Front-End Registration Form (Client-Approved Source of Truth)
- Architecture Documentation
- CRM Data Extract

Presence is evaluated as Yes, No, or Not Evident based on materials reviewed.

Field	Present in Form	Present in Architecture	Present in Data Extract
CAS Membership Selection	Yes	Yes	Yes
CANN Membership Selection	Yes	Yes	Yes
Full Name (First and Last)	Yes	Yes	Yes

Email Address	Yes	Yes	Yes
Professional Designation (discipline)	Yes	Yes	Yes
Sub-specialty Area of Focus (subspecialty)	Yes	Yes	Yes
Primary Amyloidosis Type (amyloidosis_type)	Yes	Yes	Yes
Centre / Clinic Name (institution)	Yes	Yes	Yes
Services Map Inclusion Preference	Yes	Yes	Not Evident
CAS Communication Consent	Yes	Yes	Not Evident
CANN Communication Consent	Yes	Yes	Not Evident
Non-Member Contact Name	Yes	Not Clearly Differentiated	Yes
Non-Member Contact Email	Yes	Not Clearly Differentiated	Yes
Non-Member Contact Message	Yes	Not Clearly Differentiated	Yes

Observations

Professional and institutional attributes reconcile across form, architecture, and extract using the following translations.

- Professional Designation = discipline
- Sub-specialty Area of Focus = subspecialty
- Primary Amyloidosis Type = amyloidosis_type
- Centre / Clinic Name = institution

These mappings are structurally consistent.

Map inclusion preference and communication consent fields are not visible in the extract. This indicates either an incomplete export or incomplete field persistence.

Non-member contact fields appear in the extract but lack clear structural differentiation from membership records.

Implications

If the extract is incomplete, reconciliation remains open pending a full module export.

If the extract is complete, the CRM does not persist certain consent and map-related attributes captured in the form. This condition would impair segmentation accuracy, consent enforcement, and services map governance.

Administrative Visibility and Operational Views

Observations

Current materials do not confirm that administrative users have structured views aligned to membership and consent logic. Field-level visibility into consent and classification fields remains unclear.

Working Hypotheses

- If required fields exist and are visible, deterministic operational views can be constructed.
- If visibility or permissions are restricted, administrative oversight is constrained.

Clarifications Requested

Confirm that the following views can be constructed using explicit field criteria.

- CAS Members
- CANN Members
- CAS Only
- Both CAS and CANN
- Non-Member Contacts
- CAS Communications Eligible
- CANN Communications Eligible

Confirm that administrative users have field-level access to all required membership, professional, and consent attributes.

Email Enablement Readiness

Observations

Email functionality has not yet been activated. Reliable segmentation requires validated membership logic, explicit consent capture, record classification, and confirmed field persistence.

Working Hypotheses

- If structural rules and mappings are enforced and visible, email capability can be activated with controlled segmentation.
- If structural gaps remain, campaign execution will rely on incomplete criteria.

Clarifications Requested

- Confirm consent fields are mapped, populated, and queryable.
- Confirm membership dependency logic is enforced.

- Confirm inquiry records are excluded from member campaigns by rule.
- Confirm all legacy member data resides in Zoho.

Materials Required to Close Review

The following items are required to confirm structural integrity and retire legacy datasets.

- Full Zoho Leads module export including all standard and custom fields.
- Field mapping documentation from form inputs to CRM schema.
- Documentation of workflow or validation rules governing membership dependency.
- Specifications for operational list views aligned to membership and consent logic.

Completion of these items will confirm architectural completeness and support activation of outbound communications.
